

Track and locate any key or vehicle any time to improve operations and customer experiences.

goIDit helps your dealership run more efficiently!

goIDit provides indoor location services to accurately determine a users location. As users move around the dealership the app updates their locations.

Tracker Beacons can be configured and are used to track and update the location of vehicles on a lot. The Tracker is easy to associate with a vehicle and its location is updated using the GPS from a device running the app.

If you spend time and money trying to find vehicles or keys we have a solution for you. We have developed an affordable easy to use solution that's based on wireless sensors.

Our sensors are attached to keys and vehicles that are on your lot and can be provisioned for tracking vehicles, primary or secondary keys, to identify locations for improved indoor gps, or to identify areas within your dealership the vehicles go to for maintenance or reconditioning.

Through the goIDit app and Wi-Fi gateways a sensors location is updated if it moves. The location information is uploaded to the goIDit cloud service where the sensor ID is cross referenced to the VIN, make, model, and year of the item it is attached to. Any user with the app can instantly search for and find any vehicle or key.

With goIDit:

If the key moves, we update it.

If you sell the vehicle, reassign the sensor.

If you need to find a key it's easy even if it's in a drawer.

Don't waste time and money searching for missing vehicles or keys. Get goIDit!

The location of a vehicle and its key is displayed on a map.

The location of a user and a key they are looking for is shown on a floor plan.
